MODELING UTAH POPULATION DATA

Math 1010 Intermediate Algebra Group Project

According to data from the U.S. Census Bureau, Population Division, the population of Utah appears to have increased linearly over the years from 1980 to 2008. The following table shows the population in 100,000's living in Utah according to year. In this project, you will use the data in the table to find a linear function $f(x)$ that represents the data, reflecting the change in population in Utah.

Estimates of Utah Resident Population, in 100,000's

Year	1981	1989	1993	1999	2005	2008
x	1	9	13	19	25	28
Population, y	15.2	17.1	19	22	25	27.4

Source: U.S. Census Bureau, Population Division

1. Using the graph paper on the last page, plot the data given in the table as ordered pairs. Label the x and y axes with words to indicate what the variables represent.
2. Use a straight edge to draw on your graph what appears to be the line that "best fits" the data you plotted. You will only have one line drawn, rather than several pieces of lines
3. Estimate the coordinates of two points that fall on your best-fitting line. Write these points below.

$(13, 19), (25, 25)$

Use the points that you wrote down to find a linear function $f(x)$ for the line. Show your work!

$$\frac{y_2 - y_1}{x_2 - x_1} = \frac{25 - 19}{25 - 13} = \frac{6}{12} = \frac{1}{2}x$$

SLOPE $m = \frac{1}{2}$

$$y - 19 = \frac{1}{2}(x - 13)$$
$$+ 19 = \frac{1}{2}x - 6.5$$

$$y = \frac{1}{2}x + 12.5$$

$$f(x) = \frac{1}{2}x + 12.5$$

$$f(x) = \frac{1}{2}x + 12.5$$

4. What is the slope of your line? $m = \frac{1}{2}$
Interpret its meaning. Does it make sense in the context of this situation? Please use complete sentences to respond to these questions.

YES, FROM 1993-2005 THE UTAH POPULATION GREW HALF OF 100,000 (50,000) EVERY YEAR.

5. Find the value of $f(45)$ using your function from part 3. Show your work, then write your result in the blank below.

$$f(45) = \frac{1}{2}(45) + 12.5 = 35 = 3.5 \text{ MILLION}$$

$$f(45) = \underline{35}$$

Write a sentence interpreting the meaning of $f(45)$ in the context of this project.

IF THE POPULATION RATE FROM 1993-2005 CONTINUES, IN 2025 THE POPULATION WILL BE 3.5 MILLION

6. Use your function from part 3 to approximate in what year the residential population of Utah reached 2,000,000. Show your work.

$$\text{IN } 1994 \quad x=14$$

$$\frac{1}{2}(14) + 12.5$$

$$7 + 12.5$$

$$= 19.5 =$$

$$\curvearrowright 1,950,000 \quad x$$

$$\text{IN } 1995 \quad x=15$$

$$\frac{1}{2}(15) + 12.5$$

$$7.5 + 12.5 = 20 =$$

$$\curvearrowright 2,000,000 \quad \checkmark$$

7. Compare your linear function with that of another student or group.

Comparison function: $f(x) = \frac{9}{20}x + 13.75$

Is the comparison function the same as the function you wrote down for part 3?

If they are different, explain why.

THE OTHER STUDENT GOT HIS INFORMATION FROM AN EARLIER YEAR (1985), THEREFORE HAVING A DIFFERENT POPULATION NUMBER WHERE THE RATE WASN'T GROWING AS FAST.

If they are the same, explain why.

8. In actuality, using a linear growth model for population is not common. Most models are exponential models, due to the fact that most populations experience relative growth, i.e. 2% growth per year. Linear models for nonlinear relationships like population work only within a small time frame valid close to the time of the data modeled. Discuss some of the false conclusions you might reach if you use your linear model for times far from 1980-2008.

- IN 1980 THE POPULATION WASN'T AT 1,250,000, IT WAS AT 1,520,000.

- IF RATE CONTINUED TO 2010 WOULD BE 2.25 MILLION.

THIS WOULD MEAN FROM 2008 (27.4 MILLION) THE POPULATION WOULD ONLY GROW 10,000 PEOPLE OVER A 2-YEAR SPAN. THE FORMULA STATES IT WOULD GROW 100,000 DURING THIS 2-YEAR SPAN.

- LOTS OF THINGS TO TAKE IN ACCOUNT SUCH AS SPIKE IN NEWBORNS, ECONOMY & RELOCATIONS TO ANOTHER STATE/COUNTRY.
